The background of the slide is a satellite image of a landscape, likely agricultural, with a river or canal winding through it. Overlaid on this image are numerous semi-transparent, color-coded polygons in shades of cyan, green, and yellow. These polygons represent different areas of crop water use, as indicated by the title. The colors likely represent different levels of water stress or evapotranspiration rates. The river is a prominent dark blue feature on the left side of the image.

Evapotranspiration (ET)

# OPENET

OpenET uses best available science to provide easily accessible satellite-based evapotranspiration (ET) data for improved water management across the western United States. Using the Data Explorer or Application Programming Interface (API), users can access ET data at the field scale for millions of individual fields or at the original quarter-acre resolution of the satellite data.
