

# **2019 Irrigation and Nutrient Management Meeting**

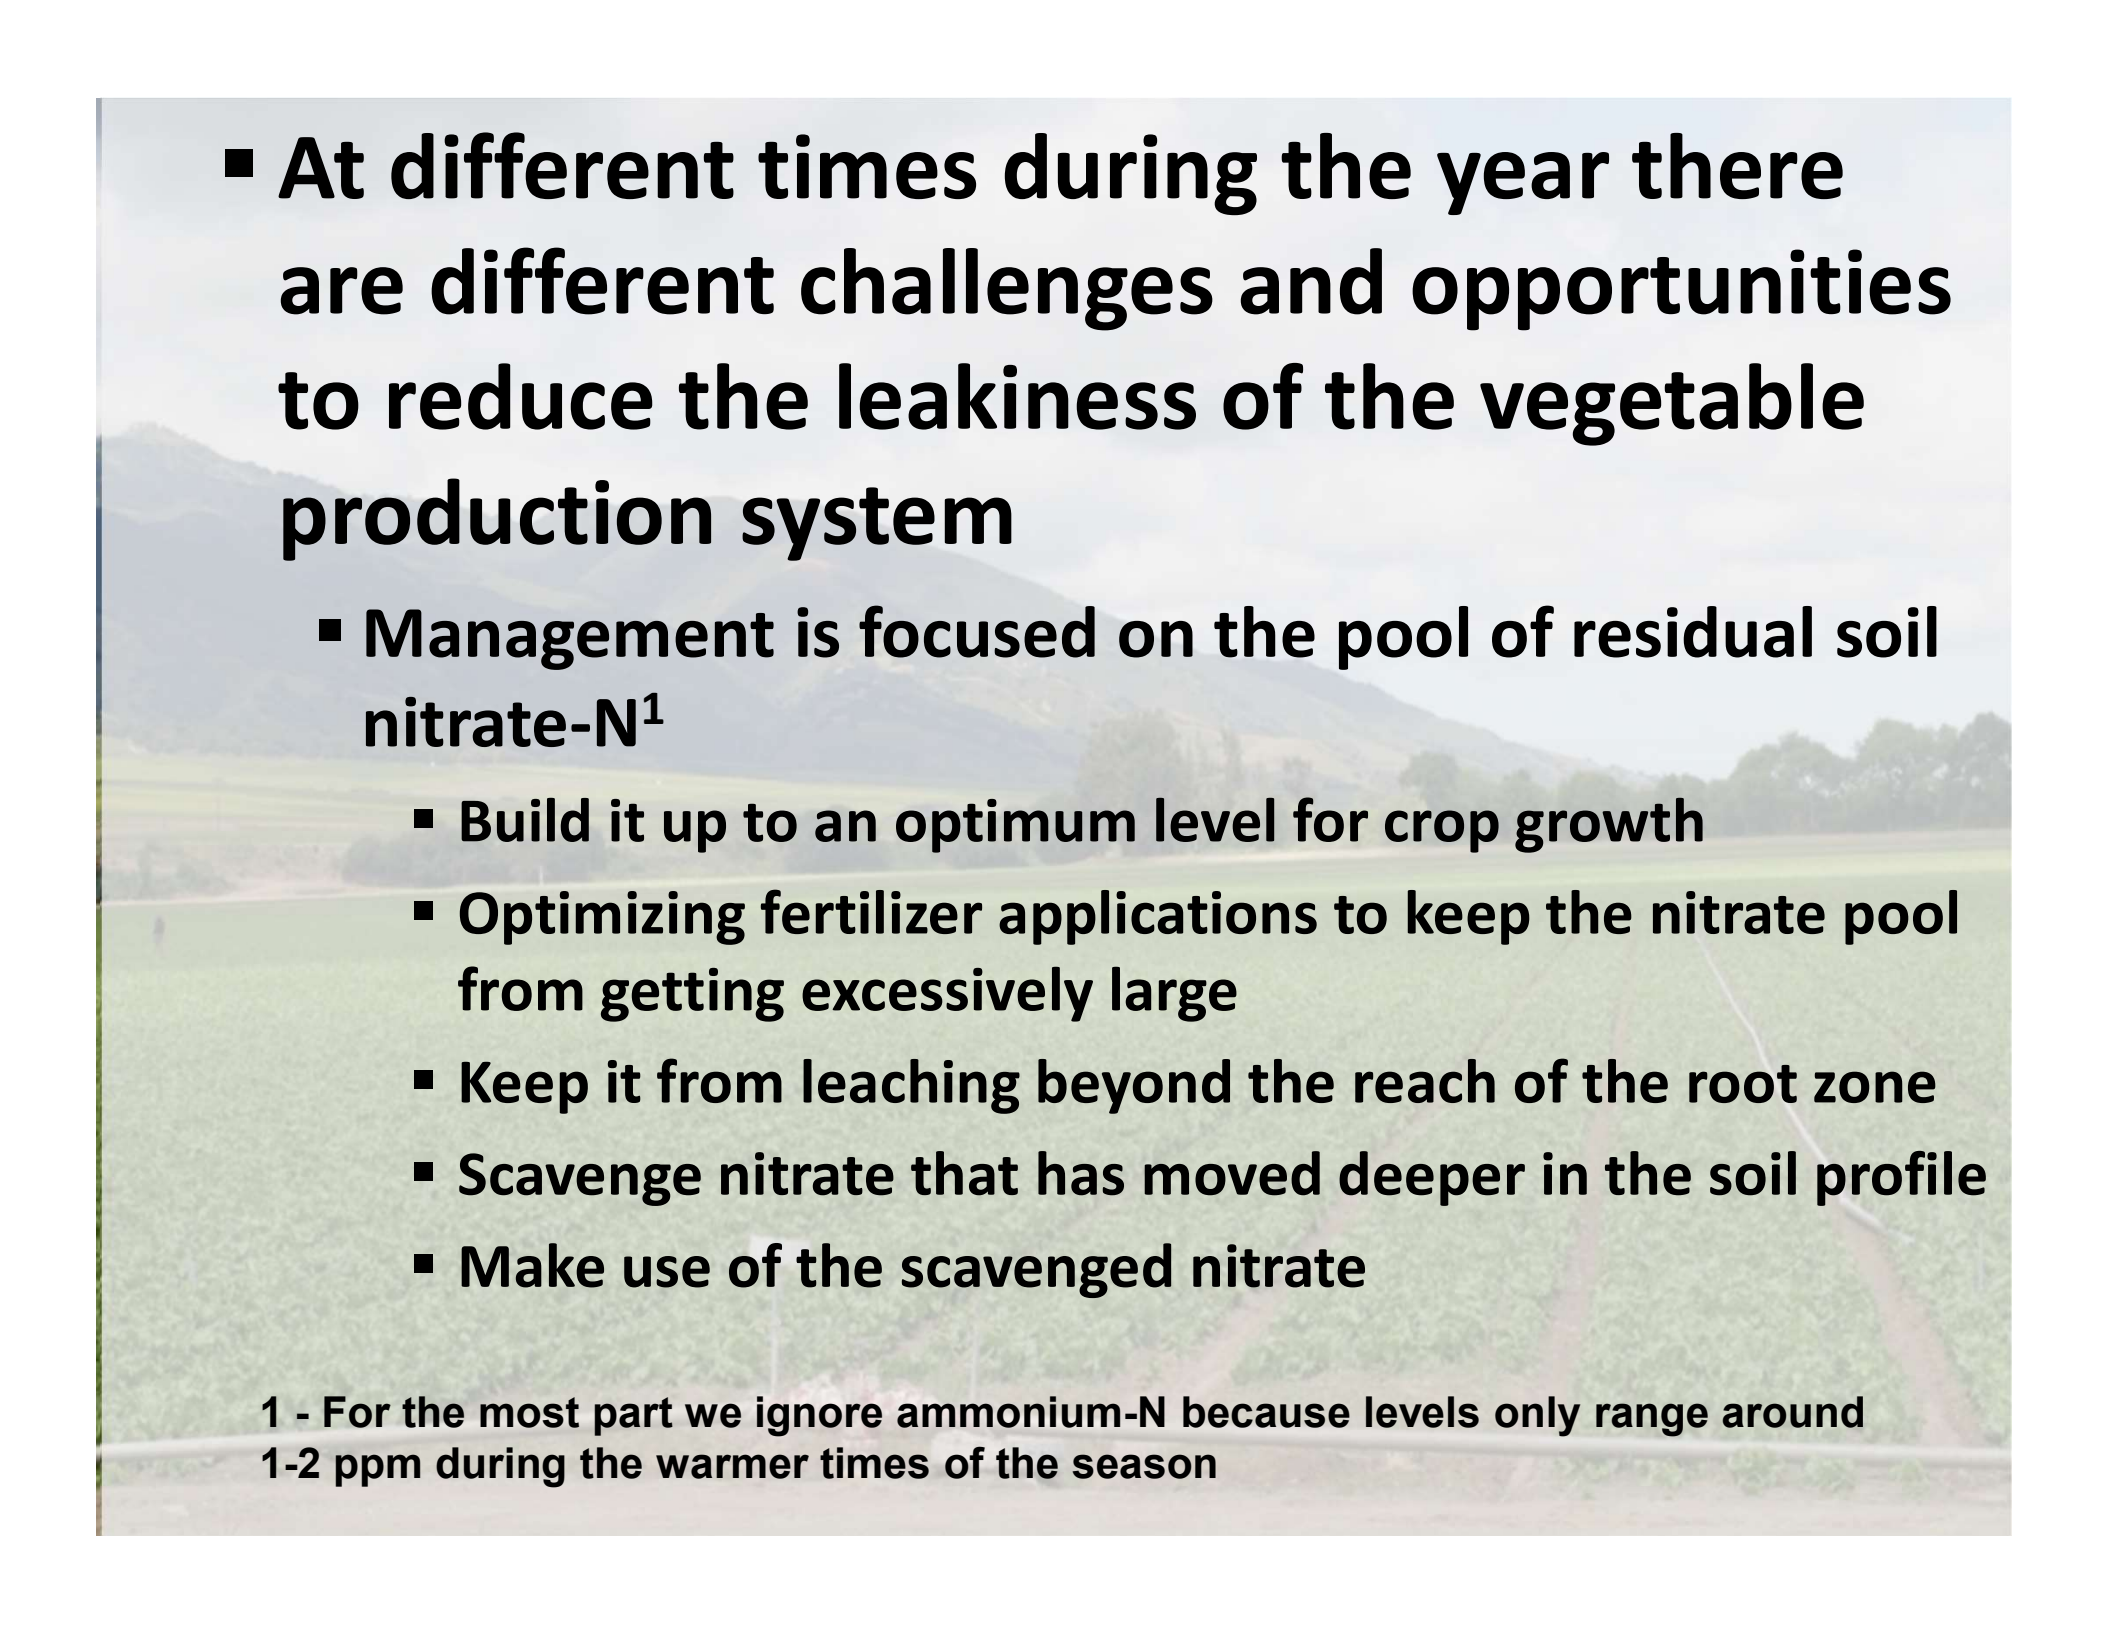

- **Certified Crop Advisor Program  
Continuing Education Credits:**
  - **CA 56570 3.0 (1.5 NM & 1.5 SW)**
- **Thank you Fresh Leaf Farms for  
the salad for lunch**
- **Please put phone on silent mode**

# **Full-Season Nitrogen Management of Vegetables**

**Richard Smith  
UC Cooperative Extension, Monterey County**

- 
- **At different times during the year there are different challenges and opportunities to reduce the leakiness of the vegetable production system**
    - **Management is focused on the pool of residual soil nitrate-N<sup>1</sup>**
      - **Build it up to an optimum level for crop growth**
      - **Optimizing fertilizer applications to keep the nitrate pool from getting excessively large**
      - **Keep it from leaching beyond the reach of the root zone**
      - **Scavenge nitrate that has moved deeper in the soil profile**
      - **Make use of the scavenged nitrate**

**1 - For the most part we ignore ammonium-N because levels only range around 1-2 ppm during the warmer times of the season**

# **First Crop – Late Winter Early Spring**

- **Residual soil nitrate pools can vary depending how much winter rain fell**
  - **In dry years, there may be sufficient residual nitrate-N to adjust fertilizer programs**
  - **In wet years (like this one) that may not be possible**
- **Fertilizer program may be adjusted based on levels of nitrate-N in the irrigation water**

# Uptake of Nitrogen by Crops:

## A starting point for understanding the N needs of vegetable crops

Crop	Crop Uptake lbs N/A	Percent removed in the harvested portion
Bell pepper	240-350	65-75
Broccoli	250-350	25-35
Brussels sprouts	350-500	30-50
Cabbage	280-380	50-60
Cauliflower	250-300	25-35
Celery	200-300	50-65
Lettuces	120-160	50-60
Baby lettuces	60-70	65-75
Onion	150-180	60-75
Spinach	90-130	65-75

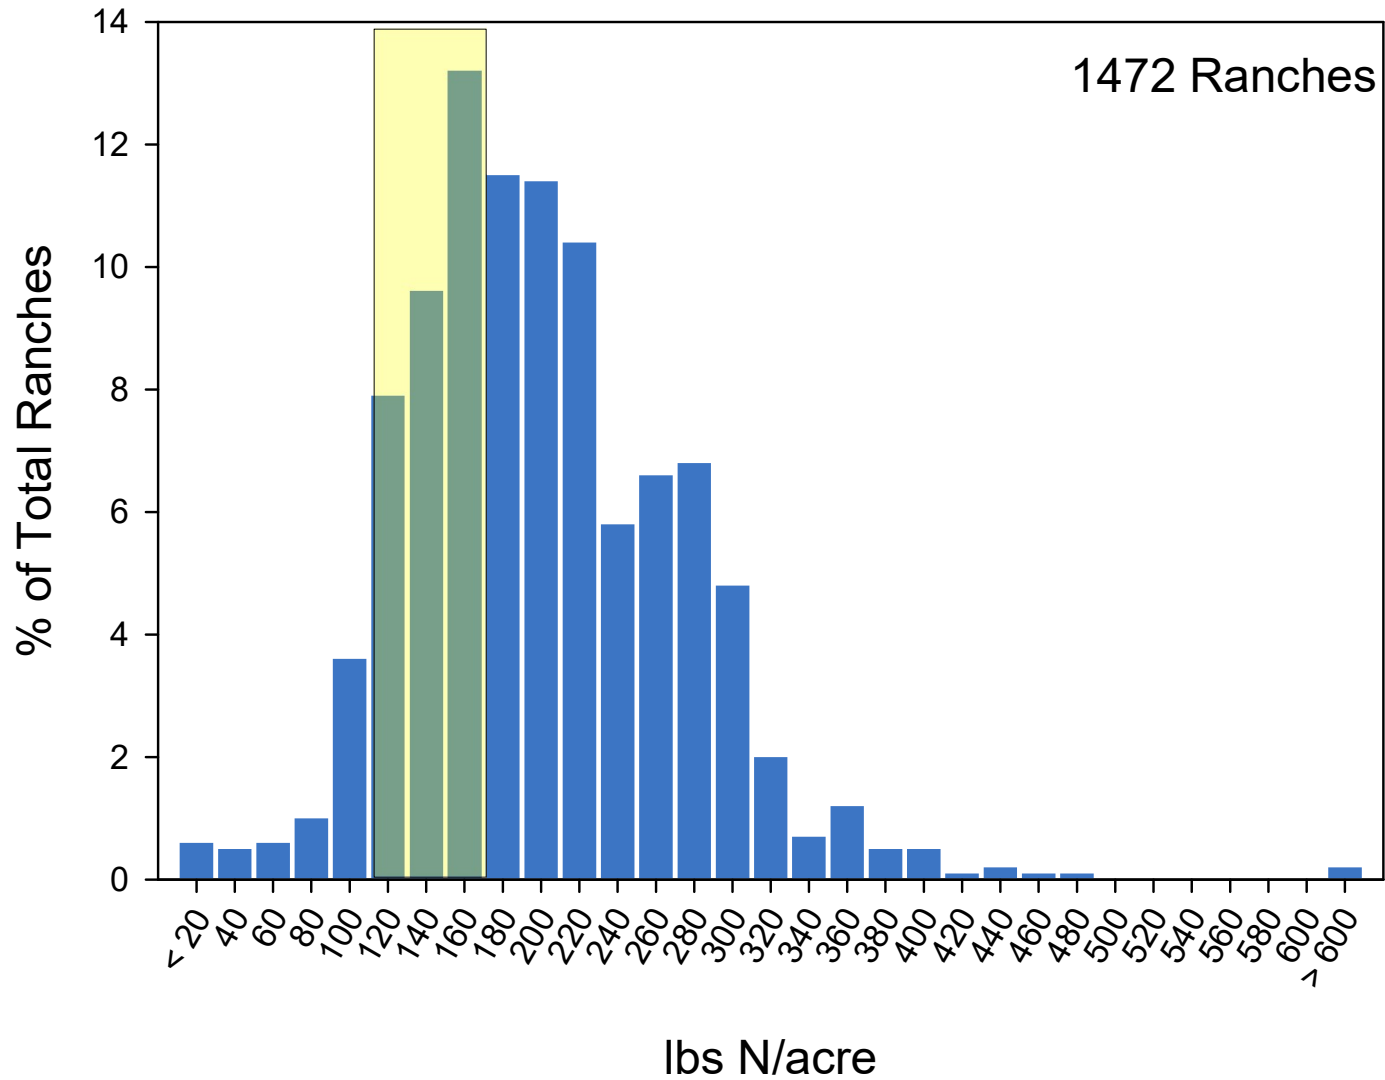

# Using a lab analysis or the nitrate quick test you can determine the quantity of residual soil nitrate

# 2017 Lettuce

# Is your N application program reasonable ?

In more than 100 lettuce fields monitored over the past decade ...

	Seasonal N application (lb /acre)	
	Spring planting	Summer planting
High	392	306
Low	70	27
Average	215	152
Average of lowest 50% of fields	149	106
Average of highest 50% of fields	281	198

Tim Hartz

# Calculating N applied from irrigation water:

$$\text{ppm NO}_3\text{-N} \times 0.23 = \text{lbs N/acre inch}$$

## Example:

- Water nitrate-N concentration = 40 ppm
- $40 \times 0.23 = 9 \text{ lbs N/acre inch}$
- If 1.5 inches of water applied:
- $1.5 \times 9 \text{ lbs} = 14 \text{ lbs N}$

# Residual Soil N and Water N

Trial No	Soil NO <sub>3</sub> -N ppm	Water NO <sub>3</sub> -N ppm	Drip Water Inches*	N in Water lbs/A
Trial 1	8	32	5.0	36
Trial 2	29	84	5.3	101
Trial 3	7	26	4.4	26
Trial 4	35	80	5.0	89
Trial 5	20	42	6.8	65
Trial 6	43	66	7.7	115

\* N from irrigation water only includes applications post thinning when plants are big enough to utilize applied N

# N fertilizer treatments (strip plots)

<b>Trial No</b>	<b>Crop</b>	<b>Grower</b>	<b>BMP</b>

## **Second Crop – Spring through Fall**

- **Substantial residual soil nitrate builds up following the first crop from mineralization of soil organic matter, unused fertilizer N, mineralization of crop residues**
- **As discussed, the residual soil nitrate can be accounted for in fertilizer programs**
- **Scavenging crops capture the pools of nitrate that have moved deeper into the soil profile**

# Nitrogen in Crop Residue

**60-80 lbs N**  
**Lettuce**

**160-240 lbs N**  
**Broccoli & cauliflower**

**60-80 lbs N**  
**Celery**

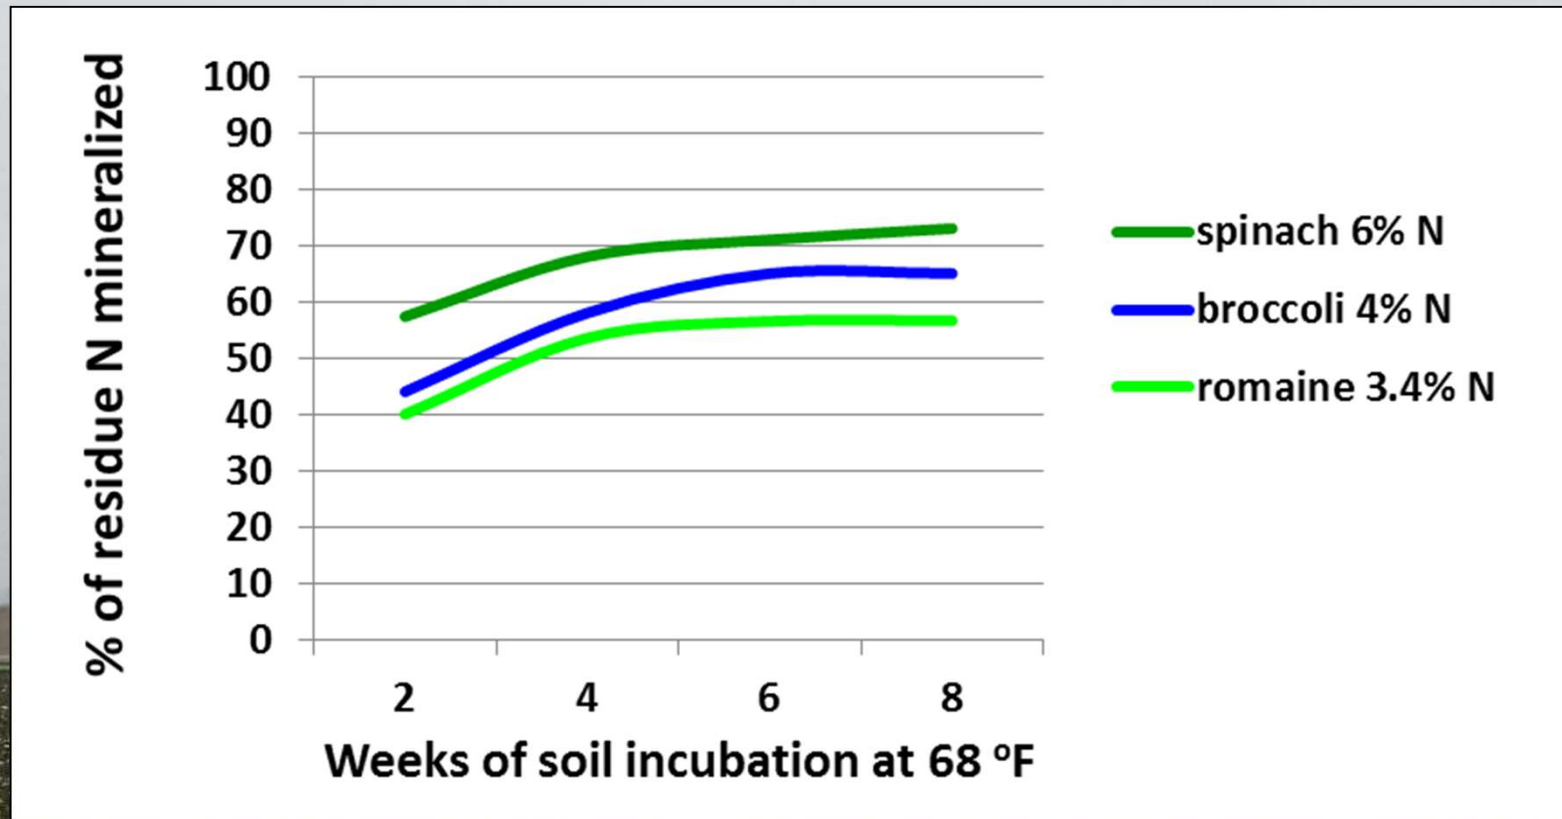

**20-40 lbs N**  
**Spinach & spring mix**

## Contribution of prior crop residue:

- Within 4-6 weeks after incorporation, crop residue N mineralization slows down
- The contribution of residue to soil N availability can be measured in the soil nitrate test taken before the first fertilization event

# The challenge is to keep the nitrate in the rootzone

Lettuce-green leaf, 6-row, 80-inch bed

## CropManage Uses Weather Based Info to Determine Irrigation Needs

# Rooting Depth of Lettuce and Spinach Over the Crop Cycle

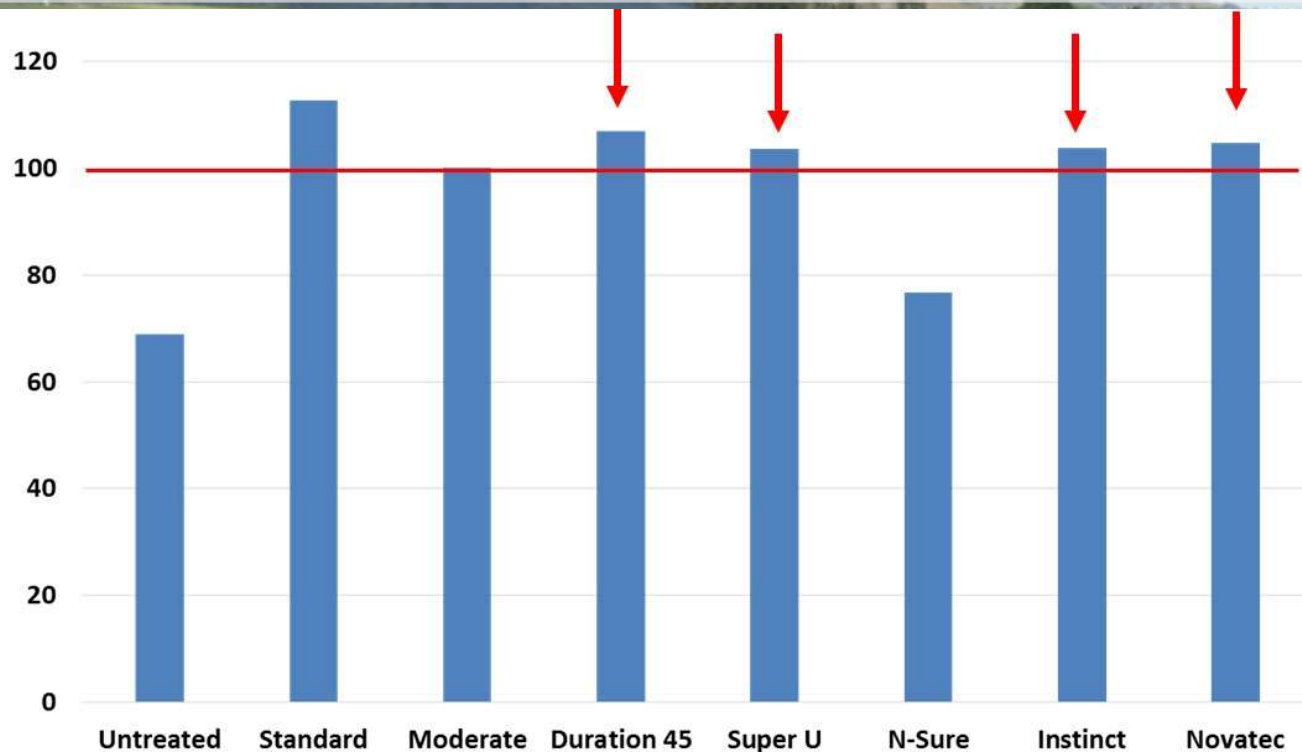

# 2017 Clipped Spinach

# High Density Crops with Sprinkler Irrigation

- Irrigation management is key to improving nitrogen use efficiency
- Nitrogen technology can help improve nitrogen use efficiency in spinach

# Rooting Depth of Broccoli and Other Crops Over the Crop Cycle

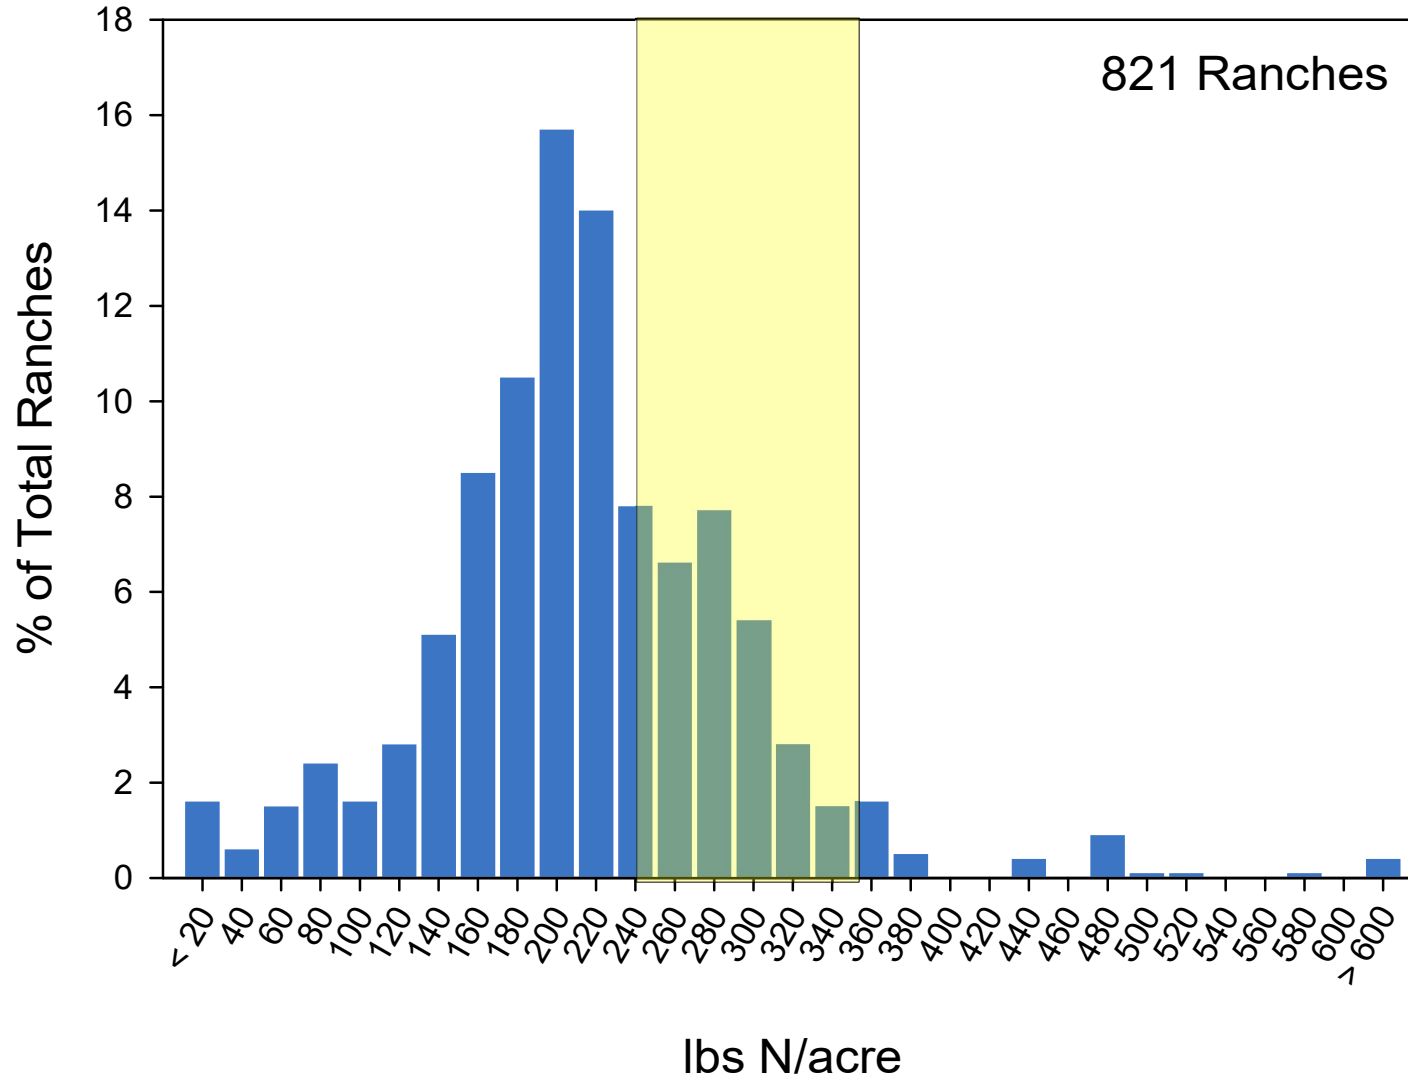

# Cole Crops

## Summer Production

Crop	Fertilizer applied	Crop Uptake	Scavenged from soil
Broccoli	181	337	155
Cauliflower	260	285	21
Cabbage	215	337	97

# 2017 Broccoli

# Ability of Broccoli to Scavenge Residual Soil Nitrate from Prior Lettuce Crop

(residual N in top 3' of soil; fertilizer rates: 160 – 200 lbs N/A)

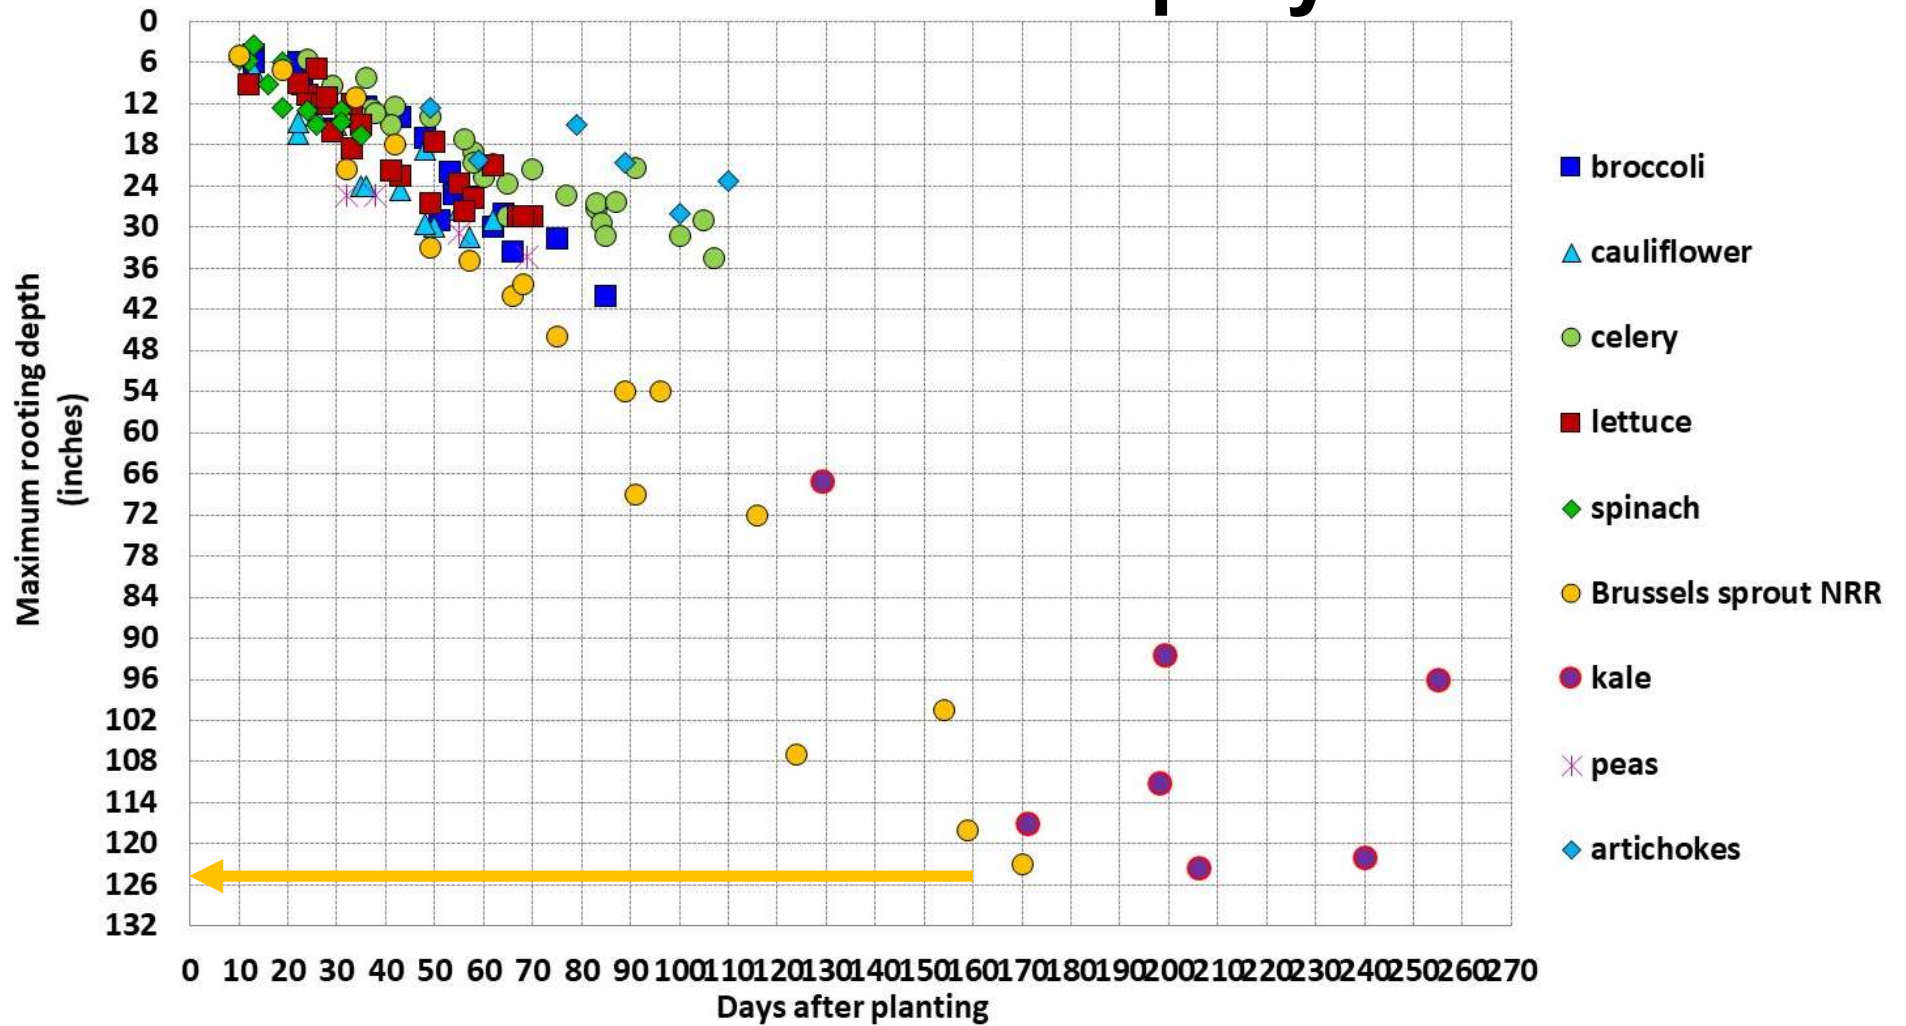

# Residual Soil Nitrate At Harvest 18 Successful Lettuce Production Fields

Made possible by utilizing residual and not over loading the soil

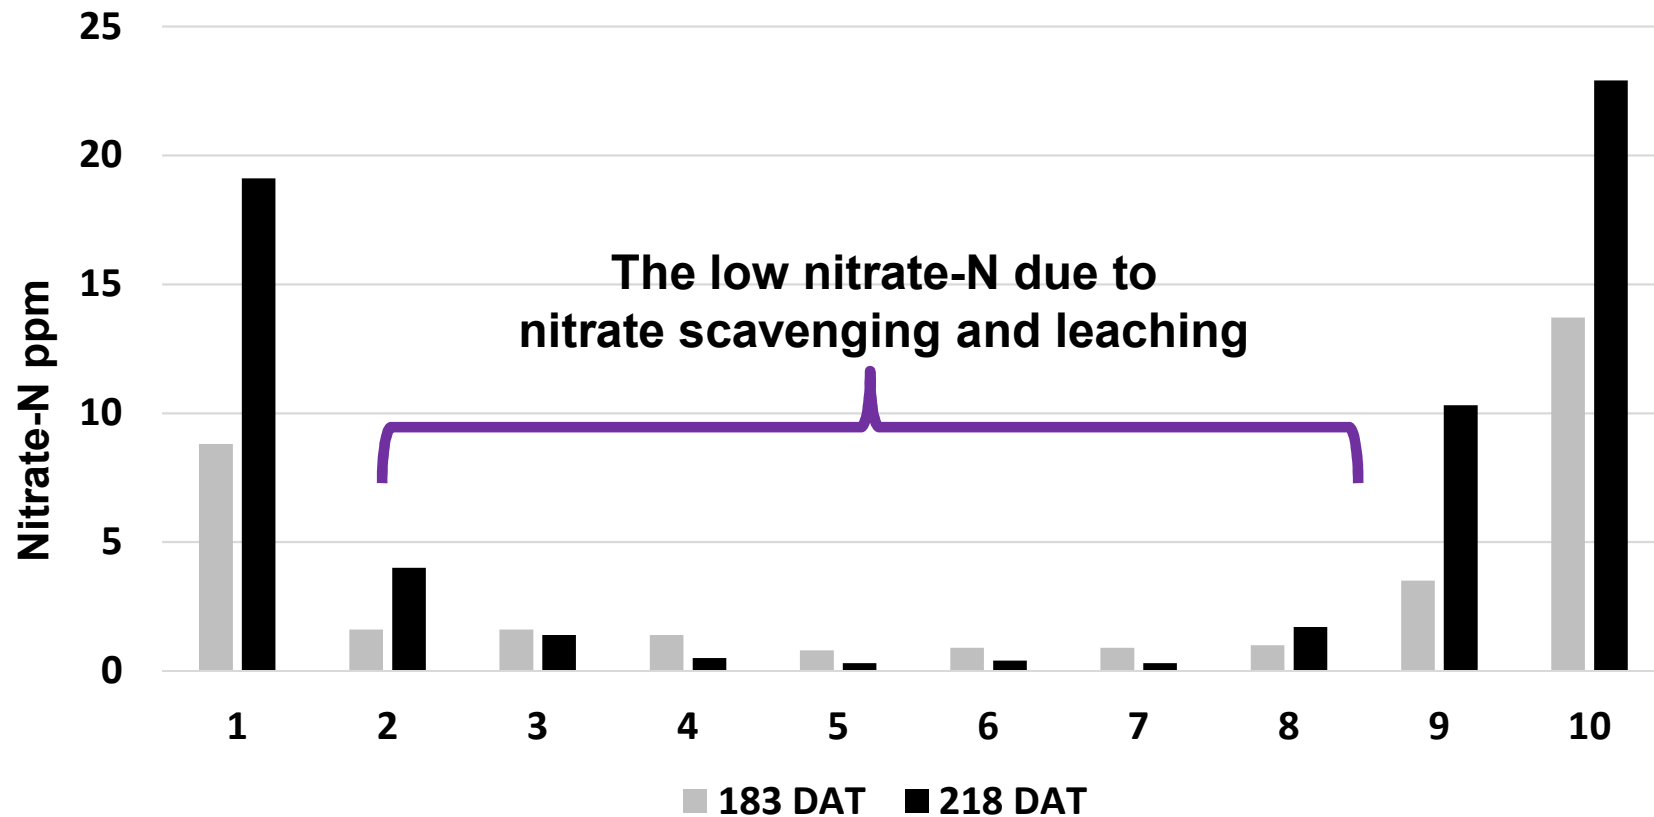

# Rooting Depth of Brussels Sprouts and Kale Over the Crop Cycle

# Curled Leaf Kale 2017

Fertilizer N = 384 lbs; Crop removal = 704 lbs; Scavenged = 320 lbs

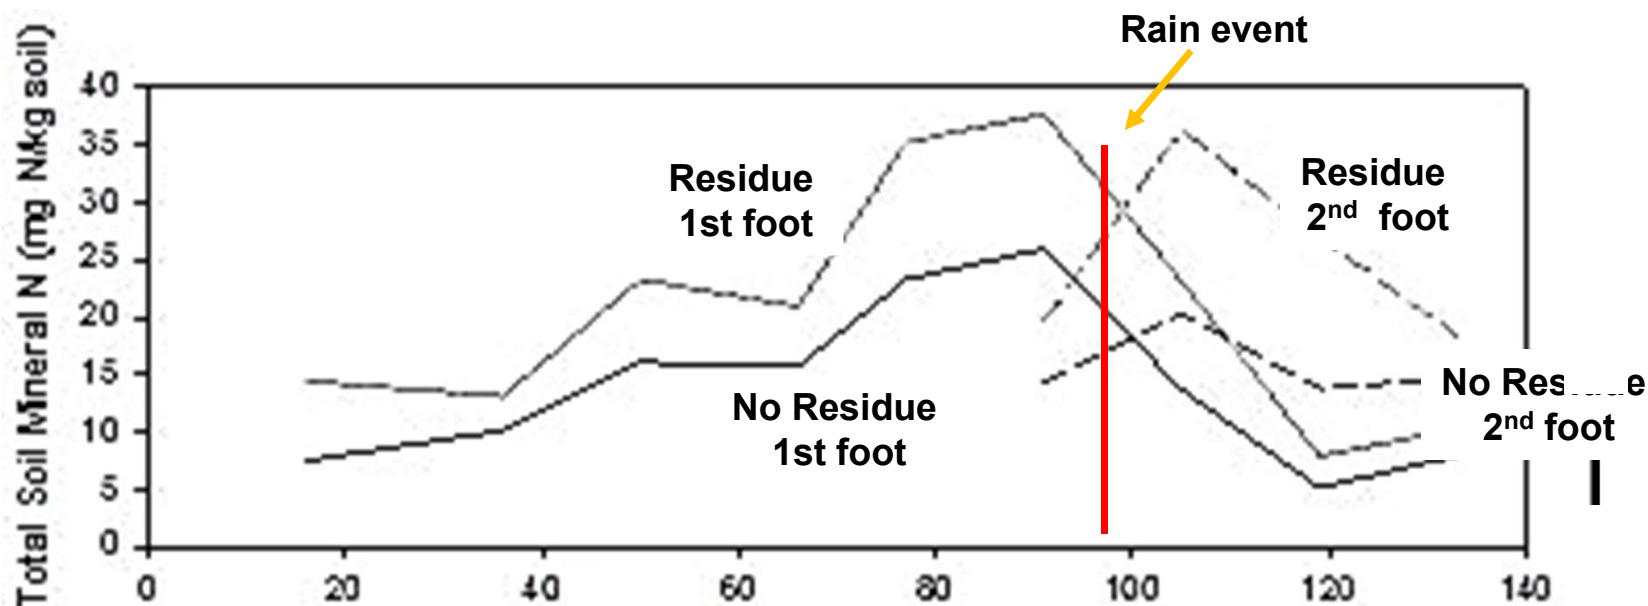

# Fall Management of Soil Nitrate Pool

- High residual soil nitrates build up in the fall
- Limitations to the use of cover crops
  - According to CCRWQCB data: 0.5% of acreage is cover cropped
- Use of compost is common
- Can high C:N compost immobilize a useful quantity of N in the fall?

# Fate of Nitrogen Mineralized from Broccoli Residue

2014-15 Field Evaluations

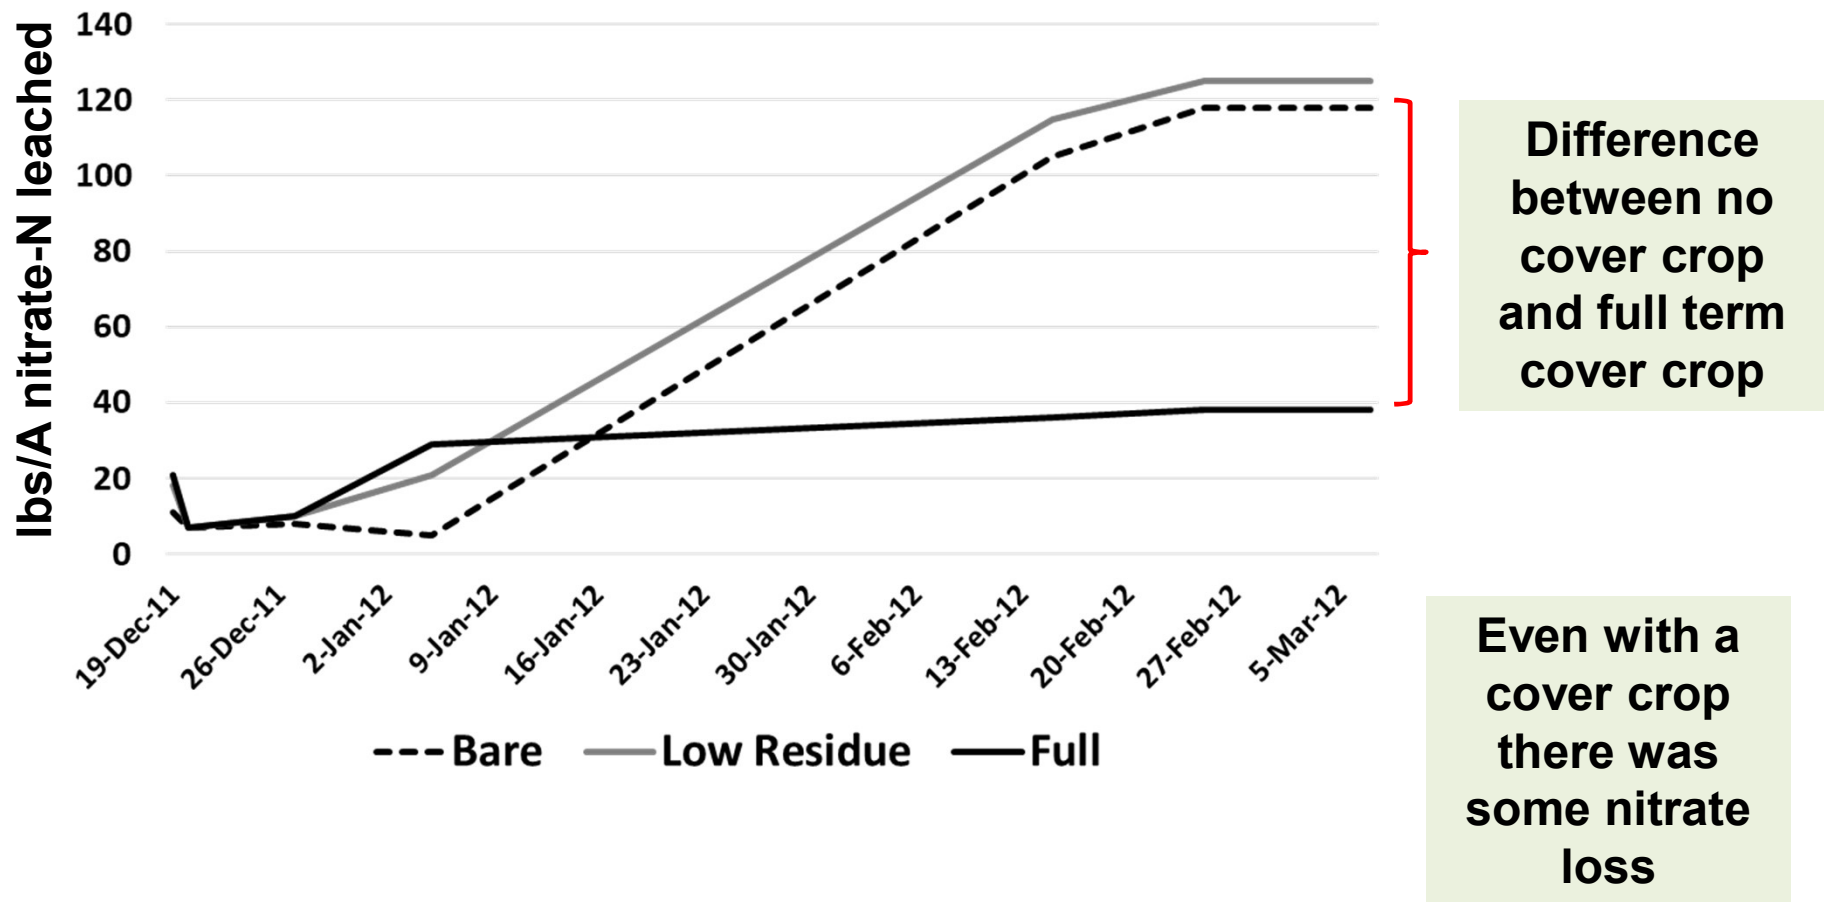

**Even where there was no broccoli residue, there was significant mineralization of soil organic matter resulting in high levels of soil nitrate-N (25 ppm)**

# Nitrate Leaching Over Winter

## Three Cover Crop Strategies: Bare Fallow, Low Residue and Full-Term

# **Immobilization of Nitrate**

- **The addition of high carbon containing materials such as green waste, straw, sawdust, almond shells, etc can result in the immobilization of nitrate in the soil**
- **Microbes utilize the availability of the labile (available) carbon and use available nitrate for their growth, thereby sequestering the N in their biomass, making it temporarily unavailable for leaching**

# 2017-18 Trial with Ground Almond Shells

**Almond Shells C:N = 70.3**

**Shells ground to 2 mm**

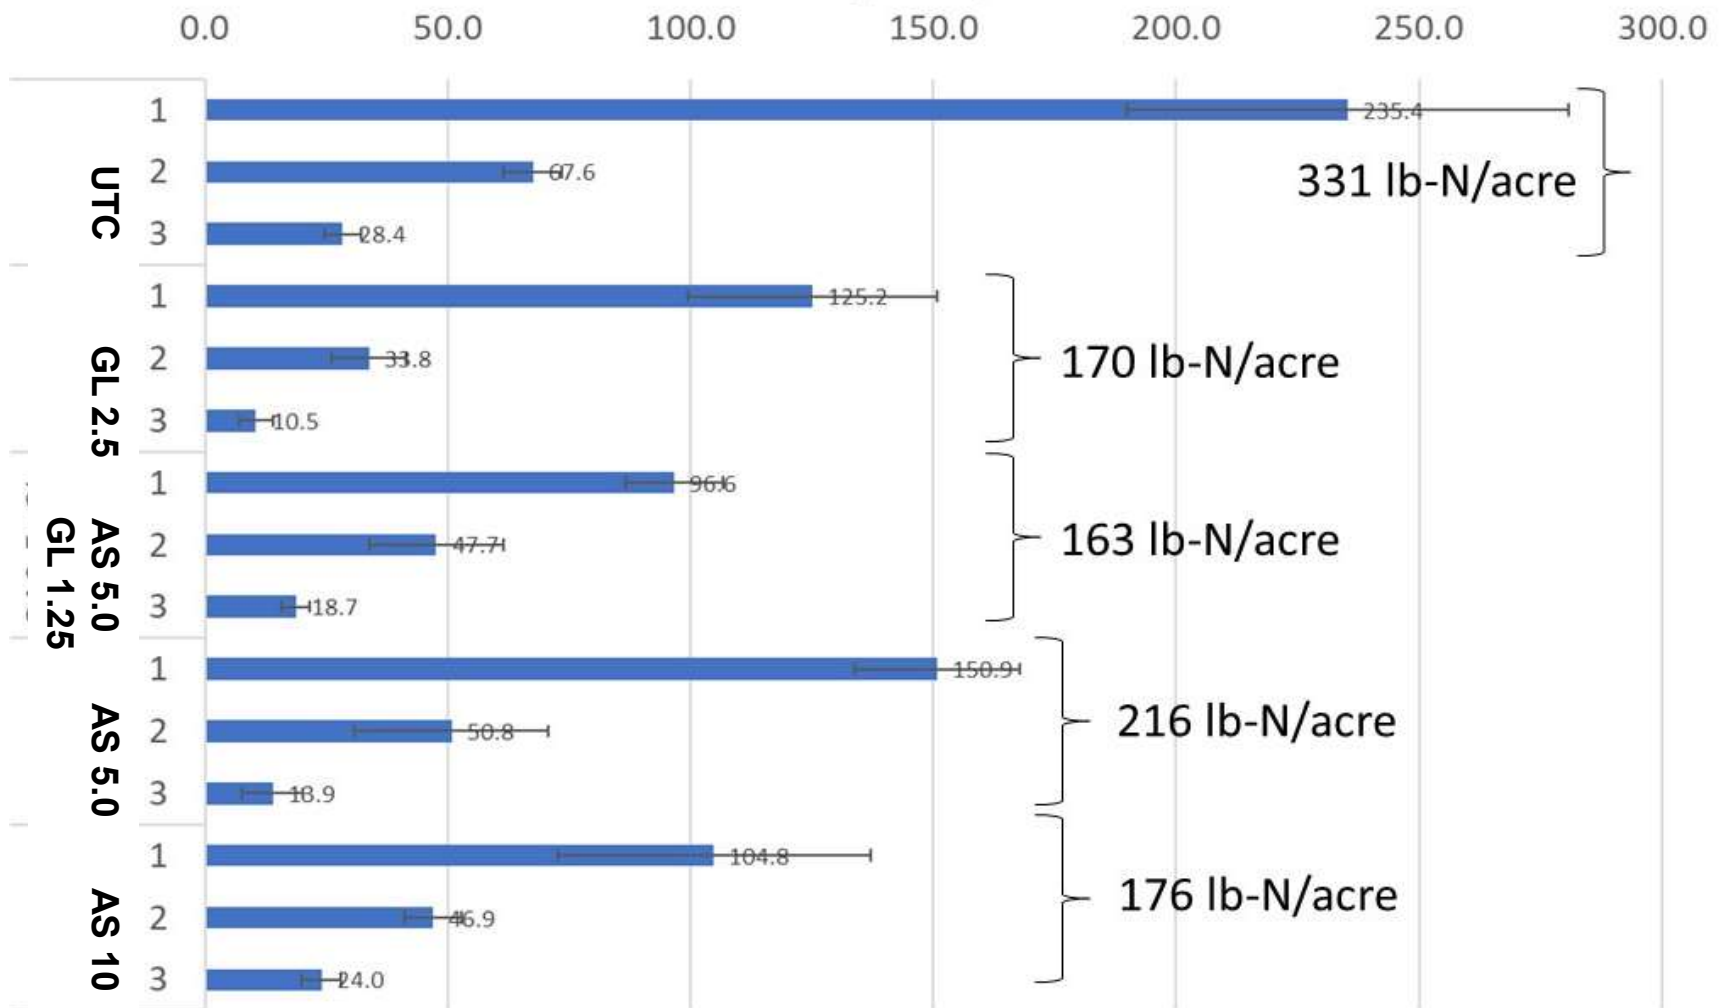

**Commercial Application  
@ 5.0 and 10.0 T/A**

**Trial before incorporation**

# Total Load of Nitrate in Top 3 Feet of Soil

<b>Treatment</b>	<b>Yield Tons/A</b>	<b>Biomass N Lbs/A</b>
<b>Untreated</b>	<b>23.4a</b>	<b>121</b>
<b>5.0 T/A Almond</b>	<b>22.9ab</b>	<b>132</b>
<b>10.0 T/A Almond</b>	<b>14.7c</b>	<b>104</b>
<b>2.5 T/A Glycerol</b>	<b>24.2a</b>	<b>130</b>
<b>5.0 T/A Almond 1.25 T/A Glycerol</b>	<b>21.3b</b>	<b>128</b>

# Next Step in Nitrate Immobilization

- Ground almond shells and glycerol work, but are too expensive
- We are looking at using locally source, high C:N compost that might be able to sequester nitrate in the same way
- The challenge will be grinding it effectively
